Conventional turbochargers use vehicle exhaust gases to spin a turbine, which transports more air into the engine. More air means more combustion, and more combustion means more power. However, exhaust-driven turbochargers require the vehicle to reach a certain speed to work effectively. At low engine speeds, the volume of exhaust gases is too low to initiate the turbochargers, which creates a turbo-lag. However, electric turbochargers eliminate the turbo-lag, provide linear supply of power, and increase the speed of the vehicle efficiently. In Addition? Electric turbochargers are efficient and environmentally good, helping to reduce the carbon footprint and other harmful gas emissions
