The global Automotive Electrically Switchable Glass market size is predicted to grow from US$ 52.1 million in 2025 to US$ 69.7 million in 2031; it is expected to grow at a CAGR of 5.0% from 2025 to 2031.

Automotive electrically switchable glass, also known as smart glass or dynamic glass, uses an electrical current to control the amount of light transmitted through it. This technology involves placing a thin film of electrochromic, photochromic, or liquid crystal material between two layers of glass. By applying a voltage, the material's optical properties change, allowing the glass to transition from transparent to opaque or varying shades of tint. This provides dynamic control over light, glare, and heat entering the vehicle.

The automotive electrically switchable glass industry is experiencing a surge in interest driven by increasing demand for enhanced comfort, energy efficiency, and design flexibility in vehicles. The trend is moving towards faster switching speeds, wider ranges of tinting, and improved optical clarity. Manufacturers are focusing on developing more durable and cost-effective materials, including new electrochromic materials and advanced liquid crystal technologies. Integration with other vehicle systems, such as climate control and infotainment systems, is also becoming more common, allowing for automated adjustments based on ambient conditions or driver preferences. Furthermore, the trend includes exploring larger-area applications, such as panoramic sunroofs and side windows, to provide comprehensive control over the cabin environment. This aligns with the broader automotive industry's focus on creating more personalized and connected driving experiences. The development of curved and

shaped switchable glass is also a key trend, enabling seamless integration with modern vehicle designs. Finally, there's a growing emphasis on sustainability, with research focusing on reducing energy consumption and using eco-friendly materials in the production of switchable glass.
