The global Automotive Electronic Insert Molding Components market size is predicted to grow from US\$ 1431 million in 2025 to US\$ 5701 million in 2032; it is expected to grow at a CAGR of 23.5% from 2026 to 2032.

Automotive electronic insert molded parts (also known as insert injection molded parts) refer to automotive components where ?inserts? made of metal, ceramic, or other hard materials are pre-placed in a mold, and then plastic is injected to combine with the molten plastic to form a single integrated part. These parts are primarily used to enhance strength, conductivity, and wear resistance, and to achieve functional integration. The upstream supply chain mainly includes high-performance engineering plastics (such as PBT, PA66, PPS, PPA), precision metal terminals (copper alloy or stainless steel), as well as mold steel and injection molding equipment. In 2025, global sales are approximately 90 million units, with an average market price of approximately US\$16 per unit. The industry's gross profit margin is in the range of 25%?35%.

Automotive electronic insert-molded components are primarily used in the three core electrical systems of new energy vehicles. They combine the excellent high strength, rigidity, heat resistance, and conductivity of metals with the good moldability, insulation, and low cost of plastics, resulting in a type of high-performance metal-plastic integrated product.

Addressing the integrated, intelligent, lightweight, and high-voltage electrification trends in new energy vehicle development, insert-molded parts offer reliable solutions with their advantages of safe insulation, robust integration, and efficient weight reduction. Insert-molded parts are rapidly gaining traction in the new energy vehicle sector, and with the steady growth of new energy vehicle shipments, the market size for insert-

molded parts in new energy vehicles is expected to continue to increase.
