## Abstracts

The global Automotive Environmental Testing Service market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Automotive Environmental Testing Service refers to a range of tests and evaluations conducted on vehicles and automotive components to assess their performance and durability under various environmental conditions. These tests are designed to simulate real-world conditions and ensure that vehicles and components can withstand extreme temperatures, humidity, vibrations, dust, water, and other environmental factors.

Some common types of automotive environmental testing include:

1. Temperature Testing: Vehicles and components are subjected to extreme hot and cold temperatures to evaluate their performance and functionality in different climates.

2. Humidity Testing: This test assesses the ability of vehicles and components to withstand high levels of humidity and moisture without corrosion or damage.

3. Vibration Testing: Vehicles and components are exposed to vibrations to simulate road conditions and evaluate their durability and resistance to mechanical stress.

4. Dust and Particle Testing: This test evaluates the ability of vehicles and components to resist the ingress of dust, dirt, and other particles, ensuring their long-term functionality.

5. Water Ingress Testing: Vehicles and components are tested for their resistance to

water ingress, including rain, splashes, and immersion, to ensure their performance in wet conditions.

6. Salt Spray Testing: This test assesses the corrosion resistance of vehicles and components by subjecting them to a saltwater mist, simulating coastal or winter road conditions.

7. UV Exposure Testing: Vehicles and components are exposed to ultraviolet (UV) radiation to evaluate their resistance to fading, cracking, and degradation caused by sunlight.

These tests are crucial for automotive manufacturers to ensure that their products meet quality standards, comply with regulations, and provide reliable performance in various environmental conditions.

Automotive is a key driver of this industry. According to data from the World Automobile Organization (OICA), global automobile production and sales in 2017 reached their peak in the past 10 years, at 97.3 million and 95.89 million respectively. In 2018, the global economic expansion ended, and the global auto market declined as a whole. In 2022, there will wear units 81.6 million vehicles in the world. At present, more than 90% of the world's automobiles are concentrated in the three continents of Asia, Europe and North America, of which Asia automobile production accounts for 56% of the world, Europe accounts for 20%, and North America accounts for 16%. The world major automobile producing countries include China, the United States, Japan, South Korea, Germany, India, Mexico, and other countries; among them, China is the largest automobile producing country in the world, accounting for about 32%. Japan is the world's largest car exporter, exporting more than 3.5 million vehicles in 2022.
