The global Automotive Extruded Parts market size is predicted to grow from US\$ 6477 million in 2025 to US\$ 10768 million in 2032; it is expected to grow at a CAGR of 7.6% from 2026 to 2032.

Automotive extruded parts are automotive components produced through an extrusion molding process. They are typically made of metal materials such as aluminum alloys and steel, and are widely used in automotive bodies, chassis, interiors, and engine components. This process involves pressing metal raw materials into a mold at high temperatures to form the desired shape, resulting in high strength, lightweight construction, and good corrosion resistance, meeting the modern automotive requirements for energy conservation, emission reduction, and safety.

The upstream raw materials for this product are mainly aluminum alloys and steel, while the downstream supply primarily goes to automakers, automotive parts suppliers, and related supporting enterprises. Downstream consumption is concentrated in the automotive body and chassis, accounting for over 60%, while engine components and interior parts account for the remaining 40%. Upstream material consumption is mainly aluminum and steel, accounting for 90%, with the demand for aluminum alloys gradually increasing to meet the market demand for lightweighting.

With the continuous improvement of global requirements for automotive lightweighting, safety, and environmental performance, the demand for automotive extruded parts is increasing year by year. Business opportunities in this field are mainly concentrated in emerging markets, especially in Asia and Latin America. With the growth of automobile production and the development of intelligent electric vehicles, the market will usher in greater growth potential. Meanwhile, with technological advancements, the cost of

extrusion molding processes is gradually decreasing, and production efficiency is further improving, which will drive the continuous development of the entire industry chain.

The market prospects for automotive extruded parts are promising, especially given the global automotive industry's trend towards lightweighting, electrification, and high performance. With automakers facing stringent requirements to reduce vehicle weight, improve fuel efficiency, and lower emissions standards, the demand for automotive extruded components has increased significantly. The widespread use of materials such as aluminum alloys and high-strength steel allows extruded components to offer not only high strength and durability but also reduced overall vehicle weight while ensuring safety, thus improving fuel economy. This advantage is particularly evident in the production of electric vehicles (EVs), as lightweighting is crucial for improving battery range and reducing energy consumption.

Furthermore, the transformation of the global automotive industry and the introduction of automated and intelligent production technologies have made extrusion molding processes more efficient and precise, continuously reducing production costs and improving product quality. This has also spurred the rapid development of the automotive parts industry, especially in emerging markets and developing countries, where the demand for high-performance, low-cost components is constantly rising as automotive production expands.

Overall, the market for automotive extruded components will continue to grow, especially driven by technological innovations in lightweighting, environmental protection, and safety. It is expected that with the rise of intelligent electric vehicles and stricter environmental protection requirements, extruded parts will become an important part of the future automotive industry, and the industry will usher in more market opportunities.
