The global Automotive Hydraulic Electronically Controlled Suspension market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The hydraulic suspension system has three major application scenarios. Firstly, in the rugged road driving scenario, through the real-time pre-scanning algorithm, according to the road surface undulation, the hydraulic suspension system is controlled to adjust the height of the wheels independently in real time, to reduce the bumps and sideways tilt of the body, so that the body can still remain level on uneven road surface, providing better experience and ride comfort.

Secondly, in the outdoor camping scenario, through the multi-valve precise control of the fluid algorithm, not only can the four wheels be lifted and lowered at the same time, but also the suspension height can be adjusted individually. When the user parks the vehicle on an uneven road, the height of the four wheels can be accurately controlled according to the needs of the entire vehicle, and the body can be adjusted to the level with one key. It can facilitate users to set up tents or sleep comfortably in the car, enhancing the comfort of outdoor camping.

Third, in the entertainment and interaction scene, as a close second space for human beings, the emerging intelligent cockpit space with driverless cars and shared cars as the main body needs to be endowed with more entertainment experiences. The vehicle somatosensory enhancement system with hydraulic suspension as the main execution body, combined with the 3D hologram technology of the smart cockpit, can enhance the entertainment interaction effect and game somatosensory, and realise the vehicle's rhythmic movement with music as well as the 4D experience effect.
