The global Automotive Intake Manifold market size is predicted to grow from US\$ 1790 million in 2025 to US\$ 1952 million in 2032; it is expected to grow at a CAGR of 1.1% from 2026 to 2032.

An automotive intake manifold is a core airflow distribution component in the engine intake system. It routes air (air-fuel mixture) from the throttle/charger to each cylinder with controlled flow balance, while leveraging runner geometry and resonator volumes to improve volumetric efficiency, transient response, NVH and emissions.

Upstream inputs include engineering polymers (e.g., GF-reinforced polyamides), aluminum alloys, seals/fasteners, plus sensors and actuators. Downstream is mainly Tier-1 supply to OEMs, with aftermarket sold as assemblies/kits.

In 2025, global automotive intake manifold production reached approximately 90 million units, with an average global market price is \$20 per unit.

The automotive intake manifold market is a key part of the engine air-path system for ICE and hybrid vehicles, directly affecting engine performance, fuel efficiency, emissions and NVH. An intake manifold typically uses a plenum-and-runner structure to distribute air from the throttle or charging system to each cylinder. In direct-injection engines, it mainly carries air rather than an air-fuel mixture. By optimizing plenum volume and runner geometry, the manifold can improve cylinder filling, airflow balance and torque delivery across targeted speed ranges. As engines move toward downsized turbocharging, higher efficiency and more refined calibration, the intake manifold has evolved from a simple air-distribution part into an integrated intake module. Product development is moving toward lightweighting, higher integration, modular design and

more stable mass production. More designs now integrate resonators, acoustic features, brackets, sensor interfaces and auxiliary-line connections to improve packaging, assembly efficiency and NVH performance. Plastics and composites, especially glass-fiber-reinforced nylon and selected polypropylene-based solutions, are increasingly used for their weight, cost, design flexibility and acoustic advantages. Injection-molded shells joined by vibration welding, followed by leak and flow testing, have become a common production route, making intake manifolds more like validated functional modules than simple molded parts. Demand remains closely tied to ICE, HEV and PHEV production, while BEVs create a long-term structural headwind because they generally do not require intake manifolds. However, hybrid growth can partly offset this pressure, as hybrid platforms often require compact packaging, better NVH control and higher integration. Key opportunities come from turbo downsizing, hybrid platform expansion, and advances in precision molding, vibration welding and in-line inspection. Overall, the market is shifting from component-level cost competition toward system-level airflow performance, integration capability and manufacturing consistency.
