Abstracts

The global Automotive Integrated Air Spring market size is predicted to grow from US\$ 1535 million in 2025 to US\$ 1974 million in 2032; it is expected to grow at a CAGR of 3.7% from 2026 to 2032.

The integrated air spring offers substantial advantages over traditional steel spring structures, especially in terms of driver comfort and safety. It is commonly utilized in axle, cab, and driver seat suspension systems. The technology features a significantly reduced natural frequency, along with the ability to individually adjust stroke height and spring travel, enhancing both ride quality and performance.

Within the secondary suspension between the bogie and the vehicle body, our air spring systems provide for the flexible mounting of the vehicle body. Air springs have a low natural frequency, which minimizes the transmission of vibrations. They decouple it from the majority of track irregularities, while also allowing the bogie to turn as the train negotiates bends.
