Automotive interlayer films are specialized polymeric layers used in laminated automotive glass to enhance safety, performance, and comfort. These films, commonly made from materials such as PVB (polyvinyl butyral) or EVA (ethylene-vinyl acetate), are positioned between glass panes. They play a vital role in holding glass fragments together during impact, thus reducing the risk of injury and improving occupant protection. Additionally, automotive interlayer films contribute to sound insulation, minimizing road noise, and offer UV protection to shield vehicle interiors from harmful sunlight. They also help in reducing glare and enhancing the overall durability and performance of automotive glazing systems.

The global Automotive Interlayer Film market size is projected to grow from US\$ 2356 million in 2024 to US\$ 2978 million in 2030; it is expected to grow at a CAGR of 4.0% from 2024 to 2030.
