Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Linear position sensors are linear variable differential transformers that are used in a variety of applications, including electronic devices, to measure and sense linear displacement. The collected data is then transformed into an analogue or digital signal. A motion controller or a digital readout can then decipher the position. Motion can be determined by tracking changes in the device's position over time. In industrial applications such as machine tools, material handling, test equipment, and motion systems, linear position sensors are widely used.
