Automobile mechanically controlled suspension is a suspension system that is used in the chassis part of a car. It uses mechanical devices to adjust the vehicle's suspension height, hardness and shock absorption effect to improve the vehicle's driving stability, comfort and passability. This suspension system usually consists of multiple mechanical components, including springs, shock absorbers, control arms, transmission mechanisms, etc. The working principle of automobile mechanical control suspension is to adjust the working state of the suspension system through mechanical devices to adapt to different road conditions and driving needs. For example, the vehicle's suspension hardness can be changed by adjusting the compression of the spring or the damping force of the shock absorber to improve the vehicle's stability when driving at high speeds; or when passing through uneven roads, the suspension height can be adjusted to improve the relationship between the vehicle body and the road. clearance to reduce bumpiness. Automobile mechanically controlled suspension usually requires manual operation by the driver, such as adjusting the working status of the suspension through buttons or knobs in the car. Some high-end cars may be equipped with automatic control systems that can automatically adjust the suspension working status according to road conditions and driving modes to provide a better driving experience.

The global Automotive Mechanical Control Suspension market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
