Abstracts

The global Automotive Micro-Motor Planetary Gearbox market size is predicted to grow from US\$ 463 million in 2025 to US\$ 729 million in 2032; it is expected to grow at a CAGR of 6.8% from 2026 to 2032.

In 2024, the global market for automotive micro-motor planetary gearboxes sold 88,863 units, and it is projected to reach 144,454 units by 2031, representing a CAGR of 7.19% from 2025 to 2031. The price of an automotive micro-motor planetary gearbox is around US\$5, with a gross margin of approximately 28%, and a single-line production capacity of 2 million units per year.

Micro-motor planetary gearboxes are a type of precision reduction mechanism employing a planetary gear structure (including a sun gear, planet gears, planet carriers, and a ring gear). They feature a compact structure, high transmission efficiency, high torque density, and good load distribution capabilities, making them suitable for automotive applications with high space and performance requirements.

Miniature drivetrains are widely used in automotive electronics, including electric seat adjustment systems, electric sunroofs, electric windows, electric tailgates, automatic door locks, electronic parking brake (EPB) systems, electronic power steering (EPS) systems, engine cooling systems, and turbocharger control systems. With the continuous development of the automotive and electronics industries, and to meet consumers' higher demands for energy efficiency, safety, comfort, and convenience, automobiles have evolved from simple transportation tools to more sophisticated mechatronic products. The increasing intelligence and electronic sophistication of vehicles, coupled with their enhanced performance, has fueled the booming automotive electronics market, creating favorable conditions for the widespread application of

miniature drivetrains in the automotive electronics field.

An automotive micro-motor gearbox is a miniaturized transmission device typically used in conjunction with a micro-motor (or micro-motor for short). Internally, it consists of multiple gear sets, operating on the principle of "small gear driving large gear" to increase output torque and reduce speed. The more gear sets there are, the lower the final output speed and the greater the output torque. This device is primarily used for controlling various movements and functions in a vehicle, adjusting the motor's output torque and speed to meet the specific needs of different application scenarios.

Automotive micro-motor gearboxes have a wide range of applications, covering areas such as electric seat adjustment, electric windows, windshield wipers, steering assist systems, air conditioning systems, sunroof and convertible roof control, electronic parking brake systems, suspension system adjustment, and rearview and side mirror adjustment. With the continuous advancement of automotive electrification, the importance of micro-motor gearboxes in the automotive industry is becoming increasingly prominent.
