The global Automotive Multilayer Chip Ferrite Bead market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Magnetic beads are specifically designed to suppress high-frequency noise and spike interference on signal lines and power lines, and also have the ability to absorb electrostatic pulses. Magnetic beads are used to absorb high-frequency signals, such as in some RF circuits, PLL, oscillation circuits, and high-frequency memory circuits that require magnetic beads to be added to the power input. Inductors are energy storage components used in LC oscillation circuits, mid to low frequency filtering circuits, etc. Their application frequency range rarely exceeds 50MHz. Magnetic beads have high resistivity and permeability, equivalent to a series connection of resistance and inductance, but both resistance and inductance values vary with frequency. The main function of magnetic beads is to eliminate RF noise present in the transmission line structure (circuit). RF energy is the AC sine wave component superimposed on the DC transmission level, and the DC component is the useful signal required. To eliminate these unwanted signal energies, use chip magnetic beads to act as high-frequency resistors (attenuators).
