The global Automotive Non-Destructive Testing Service market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Automotive Non-Destructive Testing (NDT) Service refers to the process of inspecting and evaluating the integrity and quality of automotive components, structures, and systems without causing any damage to them. NDT techniques are used to identify defects, flaws, or irregularities in automotive parts and ensure their safety and reliability.

Various NDT methods are employed in the automotive industry, including:

1. **Visual Inspection:** This involves a thorough visual examination of automotive components to detect any visible defects or abnormalities.
2. **Ultrasonic Testing (UT):** UT uses high-frequency sound waves to detect internal flaws or defects in automotive parts, such as welds, castings, and composites.
3. **Magnetic Particle Testing (MT):** MT is used to identify surface and near-surface defects in ferromagnetic materials by applying a magnetic field and observing the formation of magnetic particles at defect locations.
4. **Liquid Penetrant Testing (PT):** PT is a method that uses a liquid dye to identify surface defects in non-porous materials. The dye penetrates into surface cracks or flaws and is then removed, leaving behind a visible indication of the defect.
5. **Radiographic Testing (RT):** RT involves the use of X-rays or gamma rays to inspect

the internal structure of automotive components, such as welds, to detect defects or inconsistencies.

6. Eddy Current Testing (ECT): ECT uses electromagnetic induction to detect surface and near-surface defects in conductive materials by measuring changes in electrical conductivity.

These NDT techniques help automotive manufacturers, suppliers, and service providers ensure the quality, safety, and reliability of their products. By identifying defects early on, NDT helps prevent potential failures, accidents, and costly repairs, ultimately improving the overall performance and longevity of automotive components and systems.

Automotive is a key driver of this industry. According to data from the World Automobile Organization (OICA), global automobile production and sales in 2017 reached their peak in the past 10 years, at 97.3 million and 95.89 million respectively. In 2018, the global economic expansion ended, and the global auto market declined as a whole. In 2022, there will wear units 81.6 million vehicles in the world. At present, more than 90% of the world's automobiles are concentrated in the three continents of Asia, Europe and North America, of which Asia automobile production accounts for 56% of the world, Europe accounts for 20%, and North America accounts for 16%. The world major automobile producing countries include China, the United States, Japan, South Korea, Germany, India, Mexico, and other countries; among them, China is the largest automobile producing country in the world, accounting for about 32%. Japan is the world's largest car exporter, exporting more than 3.5 million vehicles in 2022.
