The global Automotive Power Back Door Lift System market size is predicted to grow from US\$ 610 million in 2025 to US\$ 1048 million in 2032; it is expected to grow at a CAGR of 8.1% from 2026 to 2032.

In 2025, global Automotive Power Back Door Lift System production reached approximately 733 k units, the average price is 850 usd/unit. An Automotive Power Back Door Lift System is a motorized mechanism installed in vehicles, typically SUVs, crossovers, and minivans, that assists in opening and closing the rear hatch or tailgate of the vehicle. This system is designed to provide convenience to the vehicle owner or operator by automating the process of accessing the cargo area or trunk.

Market Concentration and Major Players:

Internationally, the market for automotive electric rear door lift systems is highly concentrated, primarily in developed countries such as Europe, the United States, and Japan. Major manufacturers include Stabilus and AISIN CORPORATION. Domestically, manufacturers of automotive electric rear door lift systems include Ningbo Tuopu Group and Changzhou Kaicheng Precision Automotive Components.

Manufacturing Process and Market Trends:

The core of the electric tailgate is the electric strut assembly. First, a micro-motor is wound with enameled copper wire and vacuum impregnated for curing. Then, a two-stage planetary gear reducer increases torque and reduces noise, while a flexible coupling buffers NVH (noise, vibration, and harshness). The reducer output drives a precision lead screw, which in turn drives a guide tube for axial extension and retraction.

The outer tube of the strut is mostly made of aluminum alloy or high-strength steel pipe, laser-welded and sealed with an integrated waterproof corrugated pipe. The ball joints at both ends are machined, heat-treated, electroplated, and then riveted or pressed together. An internal Hall sensor provides position and speed feedback. The controller PCB undergoes SMT (Surface Mount Technology) and tri-proof coating before being installed in a flame-retardant housing. The entire strut undergoes full inspection and traceability on an automated line, including pressing, torque locking, lifespan testing, waterproofing, and high/low temperature stall checks.

With the popularization of SUVs and new energy vehicles, this function has been continuously moving from luxury optional features to mainstream models, moving towards hands-free opening and closing with foot-activated and UWB near-field triggering. The tailgate structure itself is accelerating the use of thermoplastic composite materials to reduce weight, and the control module is evolving towards vehicle-domain integration and OTA adjustable anti-pinch curves. Stricter anti-pinch safety regulations are also raising the threshold for research and development and reliability.
