The global Automotive SiC MOSFET Module Baseplate market size is predicted to grow from US\$ 81.64 million in 2025 to US\$ 282 million in 2032; it is expected to grow at a CAGR of 19.3% from 2026 to 2032.

An automotive SiC MOSFET module baseplate is the structural heat-spreading foundation at the bottom of an automotive-qualified SiC power module (e.g., traction-inverter phase-leg/six-pack). It spreads heat from the DBC/AMB stack to the cooling interface and provides mechanical mounting/warpage control for reliability. It ranges from flat baseplates used with TIM to advanced single-side direct cooling pin-fin baseplates for higher power density and lower thermal resistance.

Upstream covers metals/MMCs, plating chemicals (e.g., Ni/NiP), and joining/interface consumables; midstream includes forming + precision machining, pin-fin/direct-cooling feature fabrication, plating/corrosion protection, and automotive qualification (thermal/power cycling). Downstream integrates into SiC module packaging and system cooling (direct-cooled baseplates fundamentally change the thermal interface).

In 2025, global automotive SiC MOSFET module baseplate production reached approximately 7.5 million units, with an average global market price is \$11 per unit.

United States market for Automotive SiC MOSFET Module Baseplate is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
