Automotive slow-blow fuses are circuit protection components that are mainly used to withstand loads with large currents or long-duration pulse currents, such as inductive loads such as motors and valves. Slow-blow fuses are also called time-delay fuses. When the current exceeds the rated value, they will not blow immediately, but will blow after a certain time delay, so that they can withstand overload currents in a short period of time and protect the circuit from damage caused by instantaneous overcurrents. The selection of slow-blow fuses is usually based on factors such as load type, current size, working environment, and safety requirements to ensure the reliability and safety of the circuit.
