Automotive twin camshaft is an arrangement of two parallel camshafts inside the cylinder of an engine. Twin camshaft consists of two valves—one is for inlet valve and the other for exhaust valve. Generally, twin camshafts are driven either by a chain drive or belt drive; however, majority of twin camshafts are belt-driven as the cost of belt drive is less as compared to that of chain-driven camshafts. Best way to Increase airflow through the engine cylinder head. Twin camshafts help introduce air into the engine cylinder head, which in turn is expected to enhance efficiency of the engine. The opening and closing of inlet and exhaust valves is carried out by the camshafts. The parallel arrangement of twin camshafts is projected to improve engine valve timing and subsequently, boost the performance of an engine.
