The function of the automobile engine temperature sensor is to measure the temperature of the engine's intake air, cooling water, fuel, etc., and convert the measurement results into electrical signals and transmit them to the ECU. For all gasoline engine electronic control systems, the intake air temperature and cooling water temperature are the two temperature parameters necessary for ECU control, while other temperature parameters vary with the type of electronic control system and control needs. Temperature is an important parameter that reflects the thermal load status of the engine. In order to ensure that the control system can accurately control the operating parameters of the engine, the engine coolant temperature, intake air temperature and exhaust temperature must be monitored at any time in order to correct the control parameters, calculate the mass flow rate of the air sucked into the cylinder, and perform exhaust purification processing.

The global Automotives Engine Temperature Sensor market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
