Autonomous Drilling Robots (ADRs) are specially designed robotic systems that are used to attain significant increase in productivity and enable oil and gas operators to drill more safely, accurately, and consistently. Autonomous drill systems enable operations by using a single console at a location remote from the machinery. This helps multiple manufacturers operate multiple drill rigs. Autonomous drilling robots are able to replace humans when intervening in critical situations, extreme environments, or high-risk areas (remote, isolated sites or areas with extreme weather conditions). This would make operators safe by limiting their exposure to potentially dangerous conditions.
