The global Autonomous Hull Cleaning Robot market size is predicted to grow from US\$ 79.54 million in 2025 to US\$ 196 million in 2032; it is expected to grow at a CAGR of 14.0% from 2026 to 2032.

An Autonomous Hull Cleaning Robot is a robotic system designed to independently clean the underwater hulls of ships, boats, and other marine vessels without the need for direct human control. These robots are equipped with various cleaning mechanisms and technologies to remove marine growth, biofouling, and other debris that accumulate on the hull surfaces over time. The key feature of autonomous hull cleaning robots is their ability to perform cleaning tasks without constant human intervention, which can lead to increased efficiency and reduced operational costs.

In 2024, global autonomous hull cleaning robot production reached approximately 1,084 units, with an average global market price of around US\$ 67,000 per unit.

Because the ship has been sailing or anchoring in a highly corrosive seawater and strong adhesion marine biological environment for a long time, it is difficult to perform normal maintenance, causing barnacles, oysters, bryozoans, flower tube polyps, lime worms, seaweed, etc. to be attached to the part below the waterline of the hull. Microorganisms that are difficult to remove, as well as some rust scales and rust spots, etc. This increases the mass of the hull, increases the roughness of the outer surface, and significantly increases the resistance when moving forward in the water, resulting in a decrease in ship speed and a significant increase in fuel consumption. According to statistics, the annual cleaning cost of the global shipbuilding industry is close to 10 billion US dollars. Therefore, cleaning the biological layer attached to the surface of the ship is very important. It can not only save energy and reduce emissions, extend the

docking cycle of the ship, ensure the efficiency of ship transportation, but also reduce fuel consumption and transportation costs from an economic perspective.

Low cost and good cleaning effect. Using manual cleaning of ships not only takes a long time, but also requires high costs. The autonomous hull cleaning robot is highly intelligent and requires relatively low costs.
