Autotransfusion is a process of autologous blood transfusion in a patient's body during a cardiac or orthopedic surgery, patient receives its own blood after component separation, washing, and filtration.

Blood transfusion is a process of transferring of blood or blood components from a donor to a receiver intravenously. This process is used to replace the loss of blood count during various medical conditions. Blood transfusions are of two types—allogeneic blood transfusion and autologous blood transfusion. Allogeneic blood transfusion involves transfusion of blood from a donor to a recipient. Whereas, autotransfusion is a process of autologous blood transfusion in a patient's body during a cardiac or orthopedic surgery, patient receives its own blood after component separation, washing, and filtration. After purification is complete, the blood is reinfused into the patient's body. The risk of postoperative transfusion transmitted infection is very low in autologous blood transfusion as compared to allogeneic blood transfusion, which has a higher chance of transfusion transmitted infection.
