Autowalks, also known as moving walkways or travelators, are conveyor belt systems that transport people horizontally or along a slight incline, typically within large public spaces like airports, train stations, shopping malls, and exhibition centers. Autowalks are designed to help people cover distances more quickly and with less physical effort.

Autowalks consist of a series of linked metal or rubber belts, with handrails on either side. They move continuously, and passengers can step onto them and be transported to their destination. They are designed to expedite the process of traversing large, open areas. They can significantly reduce the time it takes to cover distances on foot.

Autowalks can carry a substantial number of passengers, making them useful in high-traffic locations, particularly at airports where they can move large groups of travelers simultaneously. They are often used in conjunction with elevators, escalators, and stairs

to provide comprehensive vertical and horizontal transportation options within large buildings and transportation hubs.
