An avalanche rescue beacon is a type of emergency locator beacon, a radio transceiver (a transmitter and receiver in one unit) operating at 457 kHz for the purpose of finding people buried under snow. They are widely carried by skiers, particularly back country skiers for use in case a skier is buried by an avalanche. Before setting out on an expedition, all the members of a group activate their transceivers in the transmit mode, causing the device to emit low-power pulsed radio signals during the trip. Following an avalanche, if some members of the ski party are buried, the others may switch their transceivers from transmit into receive mode, allowing use as a radio direction finding device to search for signals coming from the lost skiers. The avalanche beacon is an active device powered by batteries; a ski suit may also contain a passive RECCO transponder sewn into the clothing.

The avalanche safety equipment market is primarily driven by growing public safety concerns. The fact that avalanches can strike at any time and without warning has led to increased safety concerns. The growing popularity of snow-related activities such as skiing, hiking, and other winter sports and consumer awareness about the safety benefits of using avalanche airbags are driving the avalanche safety market. As safety is the most important consideration for industry players in the avalanche safety market, the demand for these accessories will increase in the coming years.
