Axial length measuring equipment is a measuring instrument that can measure parameters such as axial length, anterior chamber depth, and corneal curvature radius. There are two main types of instruments used to measure axial length: A-Scan ultrasound and optical biometry. A-scan, short for applanation ultrasound, has been used for many years and involves using high-frequency sound waves to measure axial length. Optical biometry, on the other hand, uses light waves to measure the length of the eye.

The global Axial Length Measuring Equipment market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
