The axially split single-stage double suction pump is a high-efficiency centrifugal pump that splits the pump body horizontally along the axis and adopts a single double-suction impeller design. It is specially developed for large flow and low to medium head conditions. Its unique structure allows the liquid to enter from both sides of the impeller at the same time, effectively balancing the axial force, reducing the bearing load, and improving operating stability and service life. The horizontal split design is easy to disassemble and maintain, and is particularly suitable for scenarios such as municipal water supply, power plant circulating water, petrochemical pipelines, and building HVAC systems that require regular maintenance. The flow range of this type of pump usually covers hundreds to tens of thousands of cubic meters per hour, and the head is generally 10 to 200 meters. It has high hydraulic efficiency and low energy consumption. It is one of the main equipment in medium and large-scale engineering water supply systems.
