BHK (Baby hamster kidney) cells line is one of the most commonly used cell lines for the expression of biopharmaceuticals, and it is also among the top three cell types that have been most frequently used for transient expression. BHK cells are originally isolated by polyoma transformation of hamster cells and have been extensively used as substrates for virus propagation for vaccine and more generally for viral mediated expression. What's more, this baby hamster kidney cell is proved to be quite successful as host cell line for stable expression of various recombinant proteins.
