The global Back-illuminated CMOS Image Sensor market size is predicted to grow from US$ 14560 million in 2025 to US$ 22050 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

Compared to conventional CMOS image sensors with a front-illuminated structure, it has achieved roughly double the sensitivity while also reducing noise. Emitting light from the back side of the silicon substrate has made it possible to increase the amount of light entering each pixel without being obstructed by metal wiring or transistors, allowing it to reduce the degradation of sensitivity caused by different optical angles. It can capture smooth, high resolution images even in settings with dark environments such as night views.

The market for back-illuminated CMOS image sensors is driven by the increasing demand for high-quality image sensors in smartphones, digital cameras, and other imaging devices.
