A Backing Plate is a critical structural component used in semiconductor Physical Vapor Deposition (PVD) to support and cool the sputtering target. It serves as the mechanical interface between the target material (target blank) and the sputtering cathode. Its primary functions are to provide structural integrity to often fragile or brittle target materials and to facilitate efficient heat dissipation from the target surface to the cooling water system. In semiconductor applications, backing plates must feature high thermal and electrical conductivity, precise dimensional stability, and a Coefficient of Thermal Expansion (CTE) that complements the target material to ensure film uniformity and prevent delamination during high-power processes.In 2025, global Backing Plates for Semiconductor Sputtering Targets production reached approximately 500 K Pcs and average price was 800 US$/Pc.

United States market for Backing Plates for Semiconductor Sputtering Targets is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
