Ultraviolet (UV) light is invisible to human eyes, and has 3 different bands based on its wavelength i.e. UV-A, UV-B and UV-C light spectrum. For killing bacteria, UV-C light is potent to kill bacteria and germs by deactivating the DNA and stops their reproduction. The hospitals, pharmacies, laboratories, baby care units are major ones using the bacteria killing lights. These are also portable devices that can be carried along anywhere, to sterilize the objects such as phone and toothbrush. Using UV-C for killing bacteria is environment friendly, eliminates use of chemicals and has no health hazards. Germicidal UV lights are most commonly used that has low pressure mercury lamps for treatment of sewage treatment, food processing and irradiation, purification of drinking water, HVAC air sterilization, water reclamation and odor control.
