A bacterial staining machine is a laboratory instrument used to stain bacterial cells for microscopic examination. This machine is designed to automate the bacterial staining process, usually requiring several steps, and manual operation may be time-consuming and labor-intensive. The working principle of a bacterial staining machine is to immerse bacterial cells in a series of staining solutions and then rinse them with water. The

staining solution usually includes crystal violet, iodine, and saffron, which are used to distinguish different types of bacteria based on the color of the cell wall. The machine is equipped with a series of chambers to accommodate staining solutions, as well as an electric arm to move bacterial samples between the chambers. The dyeing process is controlled by a computer to ensure that the sample is exposed to the correct dyeing solution at the correct time. The use of bacterial staining machines helps to improve the accuracy and reproducibility of bacterial staining, and reduces the time and labor required for the staining process.
