The global Bacterial Nanocellulose market size is predicted to grow from US\$ 538 million in 2025 to US\$ 1584 million in 2031; it is expected to grow at a CAGR of 19.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Nanocellulose is a term referring to nano-structured cellulose. This may be either cellulose nanofibers (CNF), also called microfibrillated cellulose (MFC), nanocrystalline cellulose (NCC or CNC), or bacterial nanocellulose, which refers to nano-structured cellulose produced by bacteria. Nanocellulose is produced from plant/tree through cellulose extraction or cellulose derived from bacteria via a culture medium. Some parameters of nanocelluloses are as follows: Diameter: 5 nm - 500 nm. Length: 10s nm - 100s ?m. Specific surface area: 10s - 100s of m²/g. Nnanocellulose have many special properties, such as Natural & renewable, Biodegradability, Biocompatibility, High strength & modulus, High surface area, High aspect ratio, Chemical functionality (e.g. for modification), Dimensional stability, Moisture absorption, Thermal stability (~200°C), etc.

Bacterial cellulose has shown significant promise in the biomedical field, particularly for applications like wound dressings, artificial skin, and tissue engineering scaffolds. Its biocompatibility and high moisture retention capabilities support tissue regeneration and healing processes.

The global shift towards sustainability is influencing the demand for eco-friendly

materials. Bacterial cellulose, being biodegradable and produced from renewable resources, aligns with environmental concerns and regulations driving companies toward greener alternatives.
