The global Bacteriophages Antimicrobials market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Bacteriophages, often simply called phages, are viruses that infect and replicate within bacteria. Bacteriophages are natural enemies of bacteria, and they can be harnessed for their antimicrobial properties. Bacteriophages are specific to bacteria, and each type of phage typically infects only a particular strain or species of bacteria.

Bacteriophages infect bacteria by attaching to specific receptors on the bacterial cell surface. Once attached, the phage injects its genetic material into the bacterium, taking over the bacterial machinery to replicate and produce new phage particles. As the new phage particles are produced, they eventually cause the bacterial cell to burst or lyse, releasing the newly formed phages. This process results in the destruction of the bacterial cell.

One of the key advantages of bacteriophages is their specificity. Each type of phage has a narrow host range, meaning it can only infect certain types or strains of bacteria. This specificity allows for targeted antimicrobial action without affecting non-bacterial cells, including human cells.

Bacteriophages have been explored as potential therapeutic agents against bacterial infections. This approach, known as phage therapy, involves using specific phages to target and kill pathogenic bacteria. Phage therapy has been investigated as an alternative or complementary treatment to antibiotics. Bacteriophages are used in the food industry to control bacterial contamination. They can be applied to foods to target

and reduce the levels of harmful bacteria, improving food safety.
