Bag in box container is a type of packaging used for storage and transportation of liquid. It consists of two parts: a corrugate fibreboard box, and a plastic bag inside it (also called as bladder). This plastic bag is made up of layers of metalized film or other plastics. The bag is changeable and can be replaced by the filler (user/ sender of material). The bladder also has a tap attached to it. The filler removes the tap, fills it, and attaches the tap back. Bag in box type of packaging is considered as an environment friendly alternative to other types of packaging. Bag in box containers help lower the overall packaging cost by reducing waste, using less energy, and conserving lesser raw materials. Bag in box type of packaging is currently used for liquid products and is available at a lower cost as compared to traditional packaging.
