The global Bag Sediment Filter market size is predicted to grow from US\$ 455 million in 2025 to US\$ 737 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Bag filters eliminate sediment by processing water through small permeable pores. These can range in micron size between 1-300. Made of polyester felt or polypropylene felt, bag filters come in a range of sizes and styles and can be manufactured in a high-density depth filter design. Sediment bag filters have a multitude of applications, from reverse osmosis prefiltration to processing chemicals, paints, resins, and solvents.

Water treatment refers to the whole process of adopting different water treatment processes and chemicals based on the water quality of the water to be treated, so that the water quality meets the requirements of production, life and environment. Water treatment agent is the chemical used for water treatment, also known as water treatment agent, is widely used in chemical, petroleum, light industry, textile, printing and dyeing, construction, metallurgy, machinery, urban and rural environmental protection and other industries, in order to achieve the purpose of water conservation, corrosion and scale inhibition and treatment of wastewater. According to the use of classification, water treatment agents can be divided into flocculants, anti-scaling agents, corrosion inhibitors and so on. In addition, water treatment agents also include various auxiliary agents, including defoamers, cleaning agents, pre-film agents, chelating agents, decolorizers, activated carbon, disinfectants and so on. With the increasingly serious problem of global water shortage and the gradual increase in people's concern for the environment, the global demand for water treatment chemicals continues to increase. According to the data, the global water treatment chemicals market in 2022 totaled about 40 billion U.S. dollars.
