Baking powder is a chemical leavening agent commonly used in baking. It typically contains baking soda (sodium bicarbonate), one or more acid salts (such as cream of tartar or phosphate-based acids), and a starch component that helps absorb moisture and stabilize the mixture. When combined with liquid and exposed to heat, baking powder produces carbon dioxide gas, which forms bubbles in the batter or dough and causes it to rise. There are two main types: single-acting and double-acting baking powder. Double-acting baking powder releases gas both when mixed with liquid and when heated, making it more widely used in home baking. It is commonly used in cakes, muffins, biscuits, and quick breads.

Baking soda, chemically known as sodium bicarbonate (NaHCO_3), is a single-ingredient alkaline compound used as a chemical leavening agent. In baking, it must react with an acidic ingredient—such as lemon juice, yogurt, vinegar, or brown sugar—to produce carbon dioxide gas, which helps dough or batter rise. Without sufficient acidity in the recipe, baking soda may leave a bitter or soapy taste. In addition to baking, baking soda is widely used for cleaning, deodorizing, and various industrial and household applications.
