A Balance Tank has sufficient volume to permit a non-uniform or irregular flow of liquid to be collected, mixed and pumped forward at a more uniform rate. The pumping is controlled by level sensors and its rate varies as per the depth of liquid in the Balance Tank. A Balance Tank keeps the product at a constant level above the pump inlet so that the now handled product is free of air or other gasses. The Balance Tanks are typically used in the processes where separation of two systems is desired.
