The global Balanced Whole House Ventilation Systems market size is predicted to grow from US\$ 32660 million in 2025 to US\$ 52860 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Balanced Whole House Ventilation Systems are equipment that provides fresh air to the home, usually with two fans and two duct systems. Fresh air supply and vents can be installed in each room. The most effective ventilation systems include a heat-recovery ventilator (HRV) or energy-recovery ventilator (ERV) — similar appliances that transfer heat (but not air) between a ventilation system's exhaust and supply air streams.

Home ventilation systems provide residents with a safe and comfortable living environment. These systems regulate the airflow in your home to prevent the buildup of pollutants such as smoke, carbon dioxide, and volatile organic compounds. When outdoor pollutant levels are high or indoor temperatures rise in the summer, households should install multiple ventilation fans throughout the room to expel dangerous indoor gases. Rising demand for open-plan homes, increasing construction activity in emerging economies such as India and China, and rising awareness about energy efficiency are some of the key factors driving the market growth. Additionally, growing health concerns about indoor air quality have increased the need for efficient ventilation systems in residential buildings.
