Balancing machines and systems dynamically measure and/or correct machine or component balance (load balancing). Dynamic balancing distributes the weight (mass) of a rotating body evenly around the axis of rotation, reducing vibration, improving performance and accuracy, and reducing wear. Driveshaft balancing is an important part of noise, vibration, and harshness (NVH) analysis in vehicles. A portable balancing machine can save time and money by allowing engine balancing in the field. An automatic balancing system can record vibration data, calculate a balance solution, and determine the specific rebalancing steps, after only one engine run.

The global Balancing Machine and System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
