A balancing machine is a measuring tool used for balancing rotating machine parts such as rotors for electric motors, fans, turbines, disc brakes, disc drives, propellers and pumps. Balancing machines are used to measure and correct the unbalance of rotating components (rotors). A typical balancing machine has pedestals, with some kind of roller bearings on top. A rotor is placed on these roller bearings so that the rotor can rotate easily. A belt is slung around the rotor and driven by an electric motor to make the rotor spin.

The global Balancing Machines market size is projected to grow from US\$ 728 million in 2024 to US\$ 915 million in 2030; it is expected to grow at a CAGR of 3.9% from 2024 to 2030.
