A ball lens with AR (anti-reflective) coating is an optical device consisting of a precisely polished spherical lens whose surface is coated with single- or multi-layer AR films—typically applied using PVD or CVD techniques—to greatly reduce reflective losses and enhance light transmission. These lenses are commonly used in laser collimation and focusing, fiber-to-fiber or fiber-to-detector coupling, and other imaging or sensing systems, improving overall optical efficiency and signal quality.

In terms of supply chain, the upstream includes suppliers of high-purity optical glass (e.g., BK-7, sapphire, lanthanum glass), precision grinding and polishing equipment, and AR coating materials and machinery; while the downstream comprises laser system builders, optical communications equipment manufacturers, medical imaging enterprises, and instrument integrators that embed these lenses into final devices.

United States market for Ball Lens with AR Coating is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
