The global Ball Screw Motor market size is predicted to grow from US\$ 1451 million in 2025 to US\$ 2136 million in 2032; it is expected to grow at a CAGR of 5.7% from 2026 to 2032.

The ball screw motor is a device that tightly integrates the motor body with transmission components such as the ball screw, ball nut, and slide rails, aiming to convert rotary motion into linear feed motion along the axis by driving the ball screw rotation via a servo motor. By optimizing the structural design of the slider and sliding seat, the device improves the balance of the ball nut under force, solving the technical problem of poor stability in traditional screw motors during transmission. Its core advantage lies in utilizing the extremely low friction resistance and high motion efficiency of the ball screw to achieve precise micro-feeds and ensure high precision and rigidity under high-load operation. This design transforms the sliding action of bearings into rolling action, significantly reducing drive torque and operational heat, ensuring efficient and stable dynamic response capability for the actuating mechanism within a compact space. In 2025, global Ball Screw Motor production reached approximately 7.06 million units with an average global market price of around US\$210 per unit.

With the improvement of craftsmanship, the Integrated Ball Screw Actuators have significantly improved in load-bearing capacity, operational accuracy, and lifespan. By optimizing product structures, enterprises can launch specialized products featuring high rigidity, low noise, and high corrosion resistance, thereby securing higher profits in the high-end market. Major industry trends indicate that products are accelerating towards intelligence and modularization. The integration of sensors and intelligent control systems enables Integrated Ball Screw Actuators to possess self-monitoring and adjustment capabilities. This technological upgrade enhances equipment reliability and reduces maintenance costs, helping enterprises expand high value-added service businesses. Meanwhile, in response to the demands of the Industrial Internet and green

manufacturing, enterprises will strengthen the research and development of low-friction, oil-free lubrication technology, and remote monitoring functions. This not only simplifies the system integration process but also drives the transformation of products towards energy conservation and environmental protection, enhancing the comprehensive competitiveness of enterprises in the field of intelligent manufacturing.
