Ballast tank anode refers to a sacrificial corrosion protection component used in ballast tanks of ships or other marine structures. Ballast tanks are compartments that hold water or other fluids to provide stability and balance to a vessel. These anodes are typically made of zinc or aluminum alloys and are attached to the tank's interior surfaces.

The purpose of a ballast tank anode is to act as a sacrificial electrode, corroding in place of the tank and other metallic components. As the anode corrodes, it releases ions that create a protective current, which helps prevent the corrosion of the tank's structure. By sacrificially corroding, the anode extends the life of the ballast tank and reduces maintenance and repair costs.
