A Balloon-Expandable Transcatheter Heart Valve is a type of transcatheter prosthetic valve that is deployed and anchored in the heart using balloon inflation. It is commonly used in transcatheter aortic valve replacement (TAVR) procedures. The valve consists of a bioprosthetic tissue component mounted on a metallic stent, typically delivered via catheter through the femoral artery. Upon reaching the native valve site, the balloon is inflated to expand and fix the valve in place. This design allows for high precision in placement and strong radial force, making it suitable for patients with heavily calcified or well-defined valve anatomy.
