Hemorrhoid is a gastrointestinal disorder mostly affecting adults. Hemorrhoids are caused due to the swelling of veins near the anal tissue. Usually, the tissue acts as a cushion; however, strain due to obesity or pregnancy puts pressure on these veins, leading to swelling and consequently formation of hemorrhoids inside or outside the anal region.

A significant driver in the band ligators for hemorrhoid treatment market is the prevalence of hemorrhoidal conditions and the demand for minimally invasive treatment options. Band ligators offer a non-surgical and effective approach for managing

hemorrhoids, providing relief to patients. However, a notable challenge in this market is the need for specialized training and expertise in performing the procedure. Ensuring that healthcare professionals are well-trained in using band ligators and that patients receive safe and effective treatment remains a key challenge. Promoting education and accessibility to these devices while addressing training requirements are essential to expand the adoption of band ligators for hemorrhoid treatment and improve patient outcomes.
