Anti-reflective coatings are an essential part of photolithography with the continual shrinking of pattern geometries. Anti-reflective coatings reduce reflectivity at resist interfaces, thus providing better line width control with minimal loss of resist performance. The reflectivity is reduced by either attenuating light that passes through the anti-reflective coatings or by matching the index of refraction of the anti-reflective coatings to the resist system at the exposure wavelength employed.

Global key BARC and TARC players include Nissan Chemical, Merck Group and Brewer Science etc. The top 3 companies hold a share about 77%. Asia-Pacific is the largest market with a share about 85%, followed by North America and Europe. Global origins are mainly located in North America, Europe, Japan and South Korea, with North America being the largest production region with a 33% share. In terms of product category, bottom anti-reflective coating holds a larger market share with about 94%. In

terms of application, ARF photoresists are the top application area with a market share of about 40%, followed by KeF photoresists.
