A crimp terminal is a component that connects an electrical wire to an electrical device. Mechanical pressure is applied by passing the end of the electrical wire through the crimp to connect the crimp terminal firmly to the wire. Connection to electrical equipment is made by screwing the terminal connection part of the crimp terminal to the terminal board.

Bare crimp terminals are a type of crimp terminal that does not have an insulation coating. Compared to crimp terminals with insulation coating, bare crimp terminals have the advantage of being less expensive and shorter working hours. However, they also have the disadvantage of having to be insulated after installation, depending on where they are installed.
