The global Barometric Pressure Sensor for Drone market size is predicted to grow from US$ 1673 million in 2025 to US$ 3361 million in 2032; it is expected to grow at a CAGR of 10.7% from 2026 to 2032.

The barometric pressure sensor for drones is a high-precision environmental sensing device specifically designed for unmanned aerial vehicles, with the core function of achieving accurate altitude measurement and dynamic feedback of vertical motion status through the detection of atmospheric pressure variations. Based on micro-electromechanical systems (MEMS) technology or piezoelectric/piezoresistive principles, the sensor converts pressure signals into quantifiable electrical outputs and integrates temperature compensation and signal filtering algorithms to eliminate environmental interference. Its measurement range covers low-altitude to mid-altitude pressure gradients, with an output response rate meeting the dynamic requirements of rapid drone climb, descent, and hover phases. It also features low power consumption, miniaturization, and vibration resistance, enabling integration into drone flight control systems or navigation modules to provide critical altitude reference data for flight control algorithms such as barometric altitude holding, terrain following, and 3D obstacle avoidance. Its performance metrics directly influence the flight stability and mission execution accuracy of drones under complex meteorological conditions.

Typical products include: Bosch's BMP388, Honeywell's HSCMJNN160KASA3, etc.
