The basal metabolic rate meter is a specially designed instrument for measuring the energy consumed by the human body at rest to evaluate the individual's basal metabolic rate. This measurement method is usually used to evaluate the individual's basal metabolic rate, that is, the amount of energy that the human body needs to consume in a resting state. Common basal metabolic rate measurement instruments include respiratory metabolic meters and metabolic meters. These instruments can calculate the energy metabolic rate of the human body by measuring the inhaled and exhaled oxygen and carbon dioxide content, heart rate and other indicators, and then evaluate the subject's basal metabolic rate. The level of basal metabolic rate is related to factors such as human health status, nutritional status, age, and gender. Therefore, by measuring the basal metabolic rate, doctors can better understand the physical condition and energy needs of the subject and formulate corresponding diet and exercise plans.

The global Basal Metabolic Rate Meter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.

As people's health awareness increases, more and more people begin to pay attention to their basal metabolic rate to understand their energy consumption, so as to formulate diet and exercise plans more scientifically. This has driven the growth of demand for the basal metabolic rate meter market. In addition, modern basal metabolic rate meters use more advanced technologies, such as indirect calorimetry (ICA) and gas exchange methods, which can more accurately measure the energy consumption of the human body at rest. In short, the basal metabolic rate meter market is in a stage of rapid development, and the future market has broad development prospects and potential.
