Basalt fiber expanded roving is produced by processing basalt fiber roving with a high-performance expanded roving machine. The forming principle is that high-speed airflow enters the forming and expanding channel to form turbulence, dispersing the basalt fiber and forming annular fibers, thereby giving the basalt fiber fluffy properties. Using bulked yarn, a larger area of fabric can be woven with less fabric, resulting in lower bulk density, looseness, and better performance.

The global Basalt Fiber Expanded Rovings market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
